relay-pubsub

Getting Started

2026-08-29

Full stack order: [Relay stack day-0 onboarding](#).

1. Deploy the gateway (`scripts/deploy-remote.sh`) with `RELAY_BACKEND=relay-events` and `RELAY_BASE_URL=https://<relay-host>:...` .
2. Deploy the console: `scripts/deploy-console-remote.sh <host> <user> --gateway https://127.0.0.1:8081` (upstream is loopback **on the console host** when gateway is co-located).
3. Open `https://<host>:8082/` — accept the self-signed cert.
4. Complete the **Get started** panel (or Skip): Generate → Demo → Stored.
5. Confirm status shows **Connected**.

Relay JWT is configured on the **gateway**, not in the browser.

Section	Purpose
Generate	Seed farm / edge / fleet / demo / test catalogs
Demo	One-click publish → pull → ack
Tests	In-browser health / smoke / conformance
Console → Incoming	Publish into a topic
Outgoing	Pull / live receive / ack
Stored	Inventory peek (non-consuming)
Configure	Create/delete topics and subscriptions
Logs	Live gateway log tail

1. **Publish → Relay Accept** — REST/gRPC publish maps topic → event type.
2. **Act → pull** — Relay POSTs `/v1/actions` ; consumer pulls the actions subscription.
3. **Stored inventory** — Generate catalogs, then open Console → Stored.
4. **Empty Stored** — use **Show setup guide** or Generate Demo catalog.
